

Intermas case line *DiVar* for 19 inch chassis

Outer dimensions are in accordance with 19 inch specification, but inside extension is for free assembling of PCB's or other electronic or mechanical components.

Based on case line DiVar this chassis form Intermas will allow fast and cheap assemblies to build up equipment and instruments.

The construction principle with symmetrical die cast corner profiles allows easy mounting of chassis plates or additional components by threaded inserts shoved into special slots within the corner profiles

The panels will be stacked into the aluminium die cast corner profiles and can be screwed in addition if necessary or are removable. For optional EMC shielding the proven stainless steel contact strips from Intermas can be used or be upgraded later on. On both sides front panel extensions include 19 inch mounting holes.

While using a smaller front panel without 19 inch mounting holes this chassis can be used as a desk top version as it is.
