

Intermas case line *DiVar* for measurement units

A valuable design is an important requirement for cases used for measurement units. But variability for dimensions, easy assembling and EMC shielding sometimes are also ordinary expectations in the industrial fields of test, measurement and control units.

DiVar case from Interma fits in the best way to any requirements of these applications. As bases Aluminium die cast corner profiles allow variation of every dimension as desired. The construction principle allows easy mounting of chassis plates, PCB's or additional components by threaded inserts shoved into special slots within

the corner profiles. While deciding of several materials surfaces and different colour painting a wide range of design aspects are possible. For higher EMC shielding the proven stainless steel contact strips from Interma can be used or be upgraded later on. However, beyond using flat panels for panelling guarantees cheap and easy treatment for drilling or milling
