

Industrial PCs à la Carte

You have special requirements for your industrial PCs concerning robustness, shock and vibration resistance, temperature stability and its electromagnetic tolerance? Then you set the same priorities as many of our customers who use an Intermas industrial PC consisting of industry compatible electronics and individual housing design.

As a spin-off of a former department of AEG, Intermas has a long history in housing design and integration of electronics. The product portfolio is based on those two core competences and includes beside traditional technologies like cabinets, housings and subracks with custom or 19" construction, even industrial PCs in diverse designs.

The customer can choose from a standard program 19" Rackmount IPCs, Wallmount Box IPCs and panel IPCs in different frame sizes. If your needs are not compatible to these devices, hardware and housing can be adjusted individually. Since Intermas offers construction development as well as one-stop production, you receive a significant time-to-market advantage.

The challenge of understanding new customer requirements and realizing them results in a wide know-how with years of prior experience which is a benefit for our customers. Housings consist not only of materials like aluminum, steel or stainless steel, but also of many details regarding robustness, heat and cold stability, and electromagnetic compatibility. The electronics are based on a fast developing IT world.

The advantage to use faster and more intelligent technologies has to be harmonized with long-term availability which supports the industrial practice of around 5-10 years.

As soon as you defined your requirements for your industrial PC, in cooperation with an Intermas system consultant, our development engineers immediately start to realize your product. So you can focus on the critical details. After the production of your industrial PC, either made to measure or chosen from our catalog, extensive tests and quality inspection will follow accordingly. All of our processes are certified according to ISO 9001, so you receive a high-value product.

For a smooth systems implementation, you will be covered by the Intermas team who directly develops and releases your product. Thus premium service is a key success factor for custom applications.
